## Aeration

---

**20% Off Of Service**

**C**ompacted soil and thatch are two big obstacles to a healthy lawn. Core Aeration will help to alleviate these problems by allowing beneficial air, water and nutrient movement to reach the root zone. Aeration should be a regular part of any annual lawn maintenance program to keep soil compaction and thatch in check.

For many years, professional golf course greens keepers have known that the secret to a beautiful, dense turf is to aerate their course two or three times each year to allow the healthy grass roots to thrive.

---

- \*Fills in bare spots to provide a thick, green lawn
- \*Choke out weeds and crabgrass
- \*Reduces soil compaction
- \*Increases root development
- \*Allows nutrients, water, and oxygen to get deeper into the soil.
- \*Improves overall plant health
- \*Helps decompose the thatch layer
- \*Increased seed germination through seed to soil contact

*Aerating and over-seeding your lawn in the fall will pay huge dividends come Spring when your grass comes in thicker and healthier.*
