

Fungicide Treatment

Some of the most destructive, pulverizing lawn disease can be controlled by a strong, Fungicide program. Our Fungicide Program will help prevent and control destructive lawn diseases such as: Dollar Spot, Leaf Spot, Red Thread, Brown Patch and Summer Patch.

Common Lawn Diseases

Summer heat and humidity make for a perfect recipe when it comes to lawn diseases.

Dollar Spot

Dollar Spot fungus begins to grow and infect susceptible grasses in the spring when night temperatures exceed 50°F, even though symptoms of the disease may not appear until later in the spring or early summer.

Leaf Spot

This lawn disease fungi survive the winter as spores (fungus seeds) and as mycelium (fungus strands). When spring temperatures reach 55 to 60 degrees and there is a lot of moisture from rain or dew, the fungus begins to grow and spreads its spores by wind and water.

Red Thread

Red Thread is a foliar disease that usually occurs on taller mown turfgrasses during spring and fall. Red thread symptoms create an undesirable appearance, but crowns and roots are not infected, so plants are not killed and turf eventually will recover.

Pythium Blight

Pythium Blight outbreaks are especially damaging to creeping bentgrass, annual bluegrass, rough bluegrass, and perennial ryegrass. Among turfgrass diseases, Pythium Blight receives considerable attention because it spreads very quickly, affects leaves and crowns, and kills plants, resulting in extensive loss of the turf.

Summer Patch

Summer Patch affects Kentucky bluegrass and annual bluegrass on all kinds of turf venues, including golf courses, athletic fields, professional landscapes, and residential lawns. The summer patch pathogen, *Magnaporthe poae*, is active during late spring and summer when turfgrass root growth is diminished.

Brown Patch

Symptoms of brown and large patch diseases may vary greatly with the type of grass and soil conditions. The diseases usually cause thinned patches of light brown grass that are roughly circular in shape.
