

Aeration & Seeding

Compacted soil and thatch are two big obstacles to a healthy lawn. Core Aeration will help to alleviate these problems by allowing beneficial air, water and nutrient movement to reach the root zone. Aeration should be a regular part of any annual lawn maintenance program to keep soil compaction and thatch in check.

For many years, professional golf course green keepers have known the secret to a beautiful, dense turf is to aerate their course two or three times each year to allow the healthy grass roots to thrive.

Benefits to Core Aeration & Over-Seeding

- *Fills in bare spots to provide a thick, green lawn
- *Choke out weeds and crabgrass
- *Reduces soil compaction
- *Increases root development
- *Allows nutrients, water, and oxygen to get deeper into the soil.
- *Improves overall plant health
- *Helps decompose the thatch layer
- *Increased seed germination through seed to soil contact
